**Summary of Enhanced HOW® Benefits**

**Extra Benefits—at No Extra Charge—for Those Who Need Them**

1. Provider performs a PreViser® clinical oral health risk assessment* and submits it to Northeast Delta Dental electronically.

2. Patients with a qualifying score will receive enhanced preventive benefits automatically.

3. HOW® engages members to achieve their personal best oral and overall health.

*To get your free PreViser® Oral Health Information Suite account, go to nedelta.com/Providers, log into Benefit Lookup, click on the HOW® registration link, and follow the on-screen instructions.

¹Either one nutritional counseling or one oral hygiene instruction is covered in a 12-month period.

²Sealants are a covered benefit based on caries risk assessment for unrestored primary molars and for unrestored permanent premolars, and molars—one sealant per tooth every three years.

³Combination of prophylaxis, periodontal maintenance, or full mouth debridement (once in a lifetime benefit) not to exceed four in a 12-month period.

⁴Either one nutritional counseling, or one oral hygiene instruction, or one tobacco cessation counseling is covered in a 12-month period.
Tooth Decay Risk Score: 5 out of 5

The tooth decay risk score describes the likelihood that without appropriate home and professional care, the health of your teeth may worsen, resulting in tooth decay or breakdown of existing restorations. Your score indicates that you have some active tooth decay or some existing restorations that may be failing. Your dental professional can advise you on the best strategy to correct this situation.

Restorative Needs Score: 13 out of 100

Your score indicates that you have some active tooth decay or some existing restorations that may be failing. Your dental professional can advise you on the best strategy to correct this situation.

Gum Disease Risk Score: 4 out of 5

The gum disease risk score describes the likelihood that without appropriate home and professional care, the health of your gums may worsen, resulting in infection and inflammation, and the possible loss of teeth. Your score indicates that you have moderate bone loss and/or gum tissue damage typically associated with moderate periodontitis. This damage may be the result of current active disease or the results of damage you experienced in the past. Your likely treatment and on-going maintenance needs are very substantial.

Gum Disease Score: 37 out of 100

HOW perio benefits activated with a gum disease risk score of 3, 4, or 5; or a gum disease score of 4-100
Caries Susceptibility Test D0425

CDT Code Book Description

• Not to be used for carious dentin staining

Various tests are covered under this code:

• Assess patient’s possible caries risk based on saliva condition
• Test levels of Streptococcus Mutans and Lactobacilli
• Test hydration and salivary consistency
• Test saliva’s pH

Documentation should include what condition you are testing, the brand of the diagnostic test kit you are using, and the result of the test. Include any specific information about what the results of the test achieved for the dental practice and how this information will be used for patient education.
## CDT Codes for Caries Risk Assessment

D0601 - Low Caries Risk  
D0602 - Moderate Caries Risk  
D0603 - High Caries Risk

<table>
<thead>
<tr>
<th>ADA CDT Code</th>
<th>PreViser® Caries Risk Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>D0601</td>
<td>1 or 2</td>
</tr>
<tr>
<td>D0602</td>
<td>3</td>
</tr>
<tr>
<td>D0603</td>
<td>4 or 5</td>
</tr>
</tbody>
</table>

**Please note:** The above codes are **standardly covered** once every three years for patients age 3 and older.
Documentation Checklist for Oral Hygiene Instruction and Nutritional Counseling

HOW® evidence-based dental plans provide benefits for one oral hygiene instruction, nutritional counseling or tobacco counseling visit each year for patients assessed at moderate to high risk for dental caries or periodontal disease using the PreViser Oral Health Information Suite (OHIS). Moderate to high risk is indicated by an OHIS risk score of 3 or greater. Clinical notes for the date of service should document the specific topics discussed with the patient. Submission of clinical notes or narratives is not required when claims are submitted, but may be requested for quality assurance purposes.

Oral hygiene instructions (D1330):

- Tooth brushing technique
- Flossing and use of oral hygiene aids
- Prescription and OTC rinses or dentifrices for control of bacterial plaque
- Re-mineralization therapy
- Dispense written education materials

Nutritional counseling for control and prevention of oral disease (D1310):

- Review current dietary habits including consumption of sugared beverages and other cariogenic foods
- Counsel on food selection and dietary habits related to periodontal disease and caries
- Recommendations for diet changes including the use of sugar free alternatives
- Dispense written educational materials

This checklist provides examples of documentation that would qualify for payment of these codes.
Tobacco counseling for control and prevention of oral disease (D1320):

- Type and frequency of tobacco use to assess nicotine dependence
- Discussion of risks including oral cancer, periodontal disease and other condition
- Documentation of the patient’s “readiness to quit”, as well as confidence level
- Referral to an evidence-based tobacco treatment program such as a tobacco quit line which can offer counseling and other resources
- Documentation of any recommendations made and/or prescriptions written for anti-smoking medications including nicotine replacement therapy
- Provided written education materials and/or online resources

This checklist provides examples of documentation that would qualify for payment of these codes. This information is not required for submission of claims but may be requested for auditing purposes.
Hygiene Decision-Making Process

Decision Tree

- **gross plaque & calculus inhibits oral evaluation?**
  - Yes: debridement D4355
  - No: Evaluation and Treatment Planning

  - if present, inflammation is localized
    - Prophylaxis D1110-D1120

  - generalized moderate-severe gingival inflammation — no attachment or bone loss
    - Scaling in the presence of.. D4346

  - periodontitis — with bone and attachment loss
    - SRP D4341-D4342

- **After adequate healing**

How do you explain to patients that you are completing a PreViser® risk assessment for them?

Patient: What is a PreViser® risk assessment?

Clinician: It is a new technology in our office that lets us put a number to oral disease, and that makes it easy to track changes in your oral health over time. This is similar to knowing your cholesterol level or blood pressure. Let’s see what your score is... You received a caries risk score of 3. This states that you are at moderate risk for developing caries in the future.

Patient: What can I do to get a better score?

Clinician: The caries risk score of 3 is due to your history of having had decay in the past (your existing restoration that is starting to breakdown, or the need to improve your oral hygiene, and/or the dry mouth you have due to your medications). But great news! It is possible for this risk score to improve! We want to aim for a risk score of 1! To get there, you will need to follow the home care routine that the dentist and I have set up for you.
Caries Risk Assessment: Tooth Decay Risk Score

- Describes the likelihood that without appropriate home and professional care, the health of the teeth may become worse, resulting in tooth decay or breakdown of existing restorations.
- Risk scores range from 1 (very low) to 5 (very high).
- Scores determined by risk factors and disease indicators.
- Factors used to determine tooth decay risk differ based on the age of the patient.
Caries Risk Assessment: Restorative Needs Score

• Describes the status of the teeth in a context of caries and restorations
• Scores range from 1-100
  – 1 means no natural teeth have caries or restorations
  – 2-9 means that there are 1 or more restorations, but all are sound and no caries exist
  – 10-100 means 1 or more teeth need to be restored. Score increases from 10 to 100 as the percentage of teeth that need to be restored and the percentage of restored teeth increases.
• Treatment is needed when the score is 10 or higher

Your score indicates that you have some active tooth decay or some existing restorations that may be failing. Your dental professional can advise you on the best strategy to correct this situation.
Periodontal Disease Risk Assessment: *Gum Disease Risk Score*

- Describes the likelihood that without appropriate home and professional care, the health of the periodontium may worsen and teeth may be lost as a consequence of infection and inflammation.

- Risk scores range from 1 (very low) to 5 (very high).

- Based on patient age, periodontal disease severity, smoking history, diabetic status, periodontal treatment history, furcation involvements, vertical bone lesions, subgingival calculus, and subgingival restorations.

![Gum Disease Risk Score Diagram](image-url)

The gum disease risk score describes the likelihood that without appropriate home and professional care, the health of your gums may worsen, resulting in infection and inflammation of your gums and the possible loss of teeth.
Periodontal Disease Risk Assessment: Gum Disease Score

- Describes the dentition’s severity and extent of perio damage
- Scores range from 1-100
  - 1 indicates no periodontal tissue loss
  - Score of 2-3 indicates 1 or more sextants have gingivitis, but none have periodontitis
  - Score of 4 or greater indicates permanent periodontal tissue loss
  - Score of 100 indicates most severe and extensive loss of periodontal tissue
- Based on pocket depth, BOP, and bone loss

Gum Disease Score

- 1 indicates no periodontal tissue loss
- Score of 2-3 indicates 1 or more sextants have gingivitis, but none have periodontitis
- Score of 4 or greater indicates permanent periodontal tissue loss
- Score of 100 indicates most severe and extensive loss of periodontal tissue
- Based on pocket depth, BOP, and bone loss

Your score indicates that you have moderate bone loss and/or gum tissue damage typically associated with moderate periodontitis. This damage may be the result of current active disease or the results of damage you experienced in the past. Your likely treatment and ongoing maintenance needs are significant.
Periodontal Disease Risk Assessment: *Gum Health Stability Score*

This score is an indication of how long your gum health has been stable, which is 0 at your first gum disease assessment. For subsequent assessments, your score will increase to a maximum of 100 if the condition of your gums is stable or improved. A zero stability score after treatment may mean more treatment could be indicated.

- Indication of how long periodontal status has been stable
  - Stability is defined by a previous gum disease score that is not appreciably different from the current score
  - Slight changes in pocket depth could be considered normal variation
- Score is pro-rated by days of stability between assessments with a max of 10 points per year
- In contrast to other scores, you want to see this score increase on subsequent risk assessments
Oral Cancer Risk Assessment: Oral Cancer Risk Score

The oral cancer risk score describes an increasing probability of developing mouth cancer as a result of your individual risk factors. These can include inherited factors as well as lifestyle factors.

- Describes the probability of your patient developing oral cancer
- Scores range from 1 (very low) to 5 (very high)
- Based on age, gender, oral cancer history, and the use of tobacco and alcohol
- Primary use of the oral cancer risk score is to alert your patients of their risk and counsel them about how they can reduce their risk based on the risk factors specific to them
